SIM card included

iTRACK transmitter for remote monitoring of irrigation pivots

iTrack is the ultimate tool for remotely monitoring your irrigation pivots or linears for smart irrigation without having to change your current electrical panel or make costly investments.

It will only take you 10 minutes to install iTrack on each machine. All you need to do is to fix the small transmitter provided to the pivot's pipe with two cable ties and connect the three wires (orange, brown and white) to the cables of the same colours in the terminal block in the tower box. Once the transmitter has been installed, you just access itrackirrigation.com, in order to allocate the pivot to your user account and to start monitoring the operation of your pivot anytime.

Specifications & Models

	ITRACK3GS-TR	ITRACK3G-TR
